Orig Pub : V sv.: Probl. sovrem. fiziol. nervn. i myshchn. sistem.  
Tbilisi, AN GruzSSR, 1956, 99-114.

Abstract : After separation in dogs of the sensory-motor zone from the auditory and visual cortical zones (incision in the cortex to a depth of 7-8 mm) of both hemispheres, or after a removal of the motor regions of the cortex, the food-motor conditioned reflexes (CR), developed by the method of free gait, were preserved; motor-defensive CRm including those developed (in a soundproof chamber) by tactile stimulations, were restored with difficulty only through

long periods. It is proposed that during development of food-motor CR, closure is accomplished not by associated fibers which proceed through a white substance, but either between projection zones of the cortex and subcortex or between receptor points of the cortex and the motor points situated within this same receptor region. In spite of the increase of excitability of the cortex by strychnine (0.1-1% solution), irradiation of electric primary responses were not observed during electroskin stimulations in the auditory region of the cortex and during auditory stimulations in the skin projection zone. Irradiation of excitability was found only in small areas within one and the same projection region. The influence of remote parts resulted only in a change of excitability. Removal in puppies 2-3 weeks old of both cerebral hemispheres did not lead to impairment of motor and behavioral reactions and

Subjected to Surgical Operations with a Long Period of  
Anesthesia.

Orig Pub : Tr. In-ta Fisiol. AN GrusSSR, 1956, 10, 137-149

Abstract : In the EEG of patients with chronic appendicitis, there  
were often observed appearances of rapid muscle-like  
potentials. The application of a long medicinally in-  
duced sleep (0.1 g barbamil 3 times daily in the course  
of few days pre- and postoperatively) in a number of  
cases produced a normalization of the EEG and a benefi-  
cial influence on the postoperative recovery of the  
patient.

TITLE: A Meeting With the Biologists of the Transcaucasian Region  
 (Vstrecha s biologami Zakavkaz'ya). Joint Session of the Bio-  
 logical Departments of Two Academies (Ob'yedinennyye sessiya  
 biologicheskikh otdelov dvukh akademiy).

PERIODICAL: Vestnik AN SSSR, 1958, Vol. 20, Nr 1, pp. 121-125 (USSR)

ABSTRACT: At Tbilisi a conference session of the Department for Biological  
 Sciences of the USSR and the departments of the All-Georgian Union of  
 Biological and Medical, as well as of agricultural sciences  
 took place. Also the representatives of several transcaucasian  
 republics were present, as well as a large group of scientists  
 from Moscow and Leningrad. During the congress, which lasted  
 from September 28 to October 3, 3 plenary and 4 sectional  
 sessions took place. The following reports were delivered:  
 1) I. S. Beritashvili. On the part played by the hemispheres  
 of the cerebrum and the cerebellum in the spatial orientation  
 of animals.  
 2) S. P. Charikashvili. The thalamic reticular system and the  
 primary reaction of the cerebral cortex of the large hemi-  
 spheres.

AUTHOR: Dzidzishvili, N.N.; Butkhuzi, S.M.

TITLE: Interaction between the cerebral cortex and the mesoencephalic reticular formation in the compensation of the locomotor functions

CITED SOURCE: Tr. In-ta fiziol. AN GruzSSR, v. 13, 1963, 69-76

TOPIC TAGS: central nervous system, cerebral cortex, reticular formation, mesoencephalon, locomotor function

TRANSLATION: In investigations performed on adult dogs and cats, electrolytic lesions were produced in the mesoencephalic reticular formation (MRF; diameter 3-4 mm). In dogs, areas 4 and 6 were removed; in cats, the area around the cruciform gyrus. The movement of the animals and (in part of the experiments) the conditioned reflex activity was studied under conditions of free movement. Monolateral injury to the MRF produced the short-lasting appearance of rotary movements toward the side of the injury. After bilateral injury to the MRF, an acute locomotor disorder appeared (the animals could not stand on their

Card 1/2

ACCESSION NR: AR4027233

legs) from which they recovered within 2-3 weeks. The behavior of the animals changed; they became very quiet and peaceful. At the beginning the animals would trip on obstacles during walking. Injury to the intralaminar area of the thalamus, involving the same total area as that in the MRF, did not produce changes in movement. Injury to the MRF and removal of the motor zone of the cortex (with any successive operation) brought about a pronounced, irreversible, locomotor disorder and the death of the animals. The authors conclude that there is a close connection between the MRF and the sensory-motor areas of the cortex, thus guaranteeing normal function of the two parts of the brain, representing two links in a single system. The author feels that one should not ascribe an exclusive role in the recovery of lost motor functions to the cerebral cortex. E. Rutman

AUTHOR: Dziedzianowicz, Wanda, Doctor

TITLE: Flame photometric instruments - a comparison of the Zeiss photometer (Model III) with the Lange flame photometer (Model V)

PERIODICAL: Pomiar - Automatyka - Kontrola, no. 11, 1960, 438-441

TEXT: The use of flame spectrophotometers is suggested for a quick determination of calcium concentration in water used in high-pressure boilers of power plants. Experiments were made by the Instrumentation Institute of the Central Office of Measures (Zakład Aparatury Laboratoryjnej i Naukowej Głównego Urzędu Miar) with two German flame photometers for that purpose: Zeiss Model III and Lange Model V, these being most widely used in Poland. Both of them, although differing in design, follow the same principle: the liquid examined is vaporized under pressure, mixed with an inflammable gas, burned in a burner, and the flame analyzed. An interference filter, or a monochromator selects the spectrum corresponding to the examined element, and a photoelectric cell transforms the light values into elec-

Flame photometric instruments -...

tric current which may be measured by a galvanometer. The quantitative content of the examined element in water is shown by the readings of the galvanometer; however, as the increase in the readings have no linear value, it is necessary to plot a curve first, starting with pure water, and continuing the measurements with increasing quantities of the measured element. Such a graph will allow a quick determination of the quantity of the element in question (e.g. calcium). An addition of n-propanol to the liquid contributes to better tracing of threshold values. Comparing both photometers the author comes to the following conclusions: the Zeiss photometer gives more reliable readings due to its uniform length of flame, the threshold values start at 0.01 - 0.05 mg% Ca with propanol, 0.25 - 0.5 mg% Ca in water alone (for the Lange photometer: 1.0 mg% Ca), its galvanometer is more sensitive; the Lange instrument, on the other hand, is more compact, easier to operate, is built as one unit together with its air compressor, but is less accurate (inaccuracies up to 10%). For experiments 2.4972 g of chemically pure calcium carbonate was dissolved in concentrated HCl, was then diluted with 10% solution of HCl to make 100 ml. This concentration was taken as 1,000 mg% Ca. Experience showed that the accuracy of flame

Flame photometric instruments -...

analysis depended on such factors as the exact control of gas pressure, use of uniform vessels for the analyzed liquids, maintenance of a uniform level of the liquids, exactly the same immersion of the capillary tube of the spray jet, exact focusing on the flame, and possibly quick work. The Lange photometer could probably be improved by using benzene gas and a galvanometer of the "Multiflex" type. The employment of this method stipulates, of course, that the power plant laboratories be equipped with flame photometers. Figure 2 shows the Zeiss photometer. There are 8 non-Soviet-bloc references. The reference to the most recent English-language publication reads as follows: F. Burriel-Marti, J. Ramires Munoz: Flame photometry, Elsevier Publishing Company, Amsterdam - London- New York - Princetown, 1957.
